

DRINK SYSTEM MK2

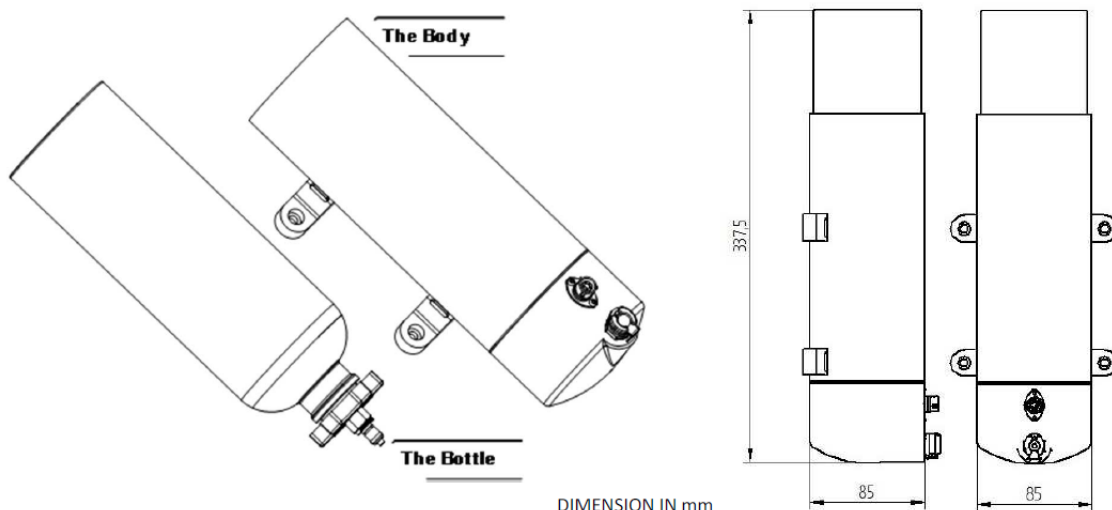

DESCRIPTION

One of the drivers' needs during the races is to hydrate themselves to keep the performance at the top. System is basically composed by the system base, car kit and helmet kit. Drink system base must be fitted into the cockpit and connected to the helmet kit through a car kit included in the system. The quick release bottle can be inserted or removed from the base in order to replace the fresh drinking fluid available in the car. Fluid will be delivered to the helmet pressing a button through an electric pump (12V power supply). Driver change is very easy and fast due to quick release connections included in the kit. The Drink System Evo is the result of several years of research and development across multiple highprofile endurance championships and in cooperation with numerous different manufacturers.

FEATURES

- Compact and lightweight
- Quick change drink bottle
- Dry-break connector
- Ring of magnets to fix the bottle
- 1.0 Lt bottle
- Simple to use and install
